

### BE - Image Acquisition

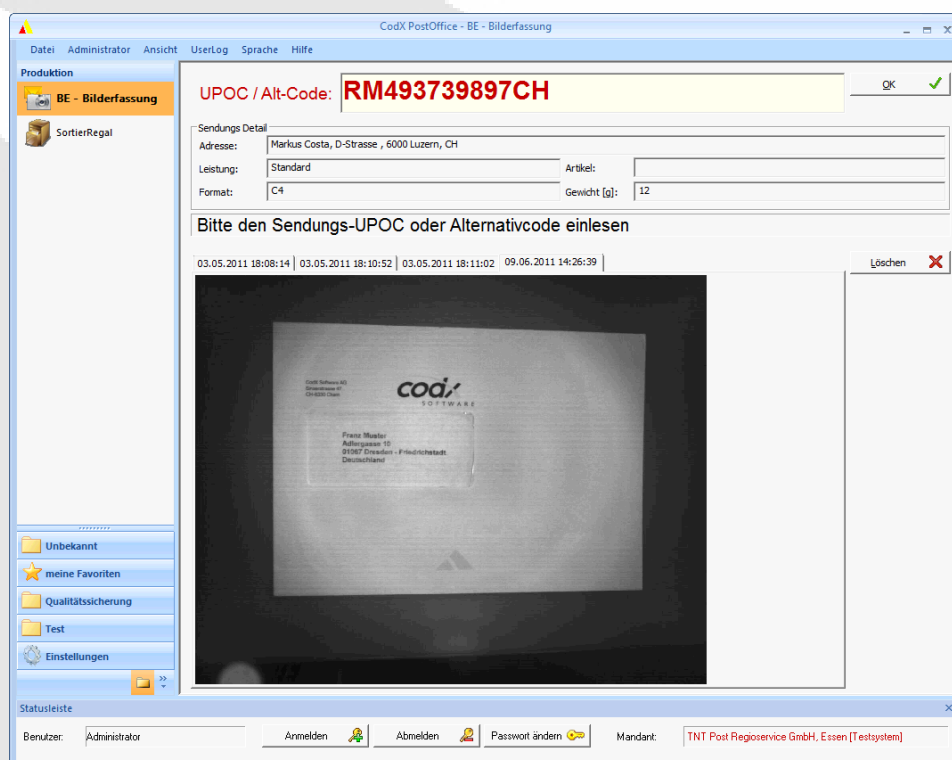

#### Overview

The module *BE – Image Acquisition* serves as an interface to acquire images and saving those automatically to the mail item information. These images then can be used for instance as a proof on damaged mail items. Otherwise it serves as a source for information and documented evidence.

#### Benefits

- ✓ Possibility of proof for damaged mail items
- ✓ Support of investigating the source of the reason
- ✓ Shows the mail items information

### The concept

The mail items to be documented already are captured in the database of *CodX PostOffice* and will be called using the scanner. This can be done using the *UPOC* or the alternative code. In the first step, the images taken so far will be shown. But besides that, you can also add further images, again using the handheld scanner.

### Image acquisition

The camera for the image acquisition is conveniently integrated within the very same scanner. That way an image can be taken right after scanning the mail item without needing any more hardware.

This of course saves you plenty of time and both devices needed are always ready to hand and to use.

Motorola Symbol DS6707  
Digital Imager Scanner
